Spin-Guard Introduces New Concept Security Fastener That Converts Standard Hex Bolts Into Tamper-Resistant Security Bolts

Spin-Guard LLC (Minneapolis, MN) has introduced a product that fastener distributors haven't seen before: a patent-pending retrofit security system that converts standard hex bolts into tamper-resistant security fasteners. The concept is straightforward. A free-spinning stainless steel cover slips over an existing hex-head bolt. A precision bushing carries the bolt load independently, leaving the outer cover free to rotate. Grab it with locking pliers, a pipe wrench, or a universal extraction socket — it just spins. Nothing engages. Nothing moves.

"Many security fasteners rely on specialty recesses or pin-drive systems that can eventually be defeated using universal extraction sockets," said co-founder Rolf Scholtz. "Spin-Guard protects the hex bolt itself behind a freely rotating shield."

The distributor advantage is straightforward: One Spin-Guard SKU per bolt diameter covers every length, thread type, and finish

PROTECT YOUR NUTS *(and bolts)*

**TURN STANDARD
HEX BOLTS INTO
SECURITY BOLTS**

- ✓ Installs in seconds
- ✓ Uses existing hardware
- ✓ Defeats universal socket tools

"One SKU per diameter covers every bolt length, thread type and finish"

within that diameter, dramatically reducing inventory complexity. For distributors serving municipalities, utilities, parks departments, corrections facilities, schools, and solar installations, Spin-Guard gives sales reps a compelling new reason to revisit existing accounts — offering a retrofit solution to exposed hex bolts already installed in the field.

Spin-Guard also fills a gap in the market: torque capacity and larger size bolts. Because the bushing

carries load independently of the spinner, the system supports higher torque specifications than most security screws — making it viable for larger fasteners where security options are scarce.

All components are manufactured from 303/304 stainless steel and carry a lifetime warranty against corrosion and workmanship defects. Available in 1/4" through 12mm, with additional sizes in development. Distributor sample kits available.
